## Apache Web Server

Apache is the most popular HTTP server on the Internet. It is a robust implementation of a web server that is packed with features and designed to be of commercial grade quality.

Apache is highly configurable and can be extended with third party modules. It allows you to customize responses to errors and problems with files and CGI scripts. This latest version 2.0.47 fixes several security issues.

## Webmin 1.100

Webmin is a browser based system administration tool that lets you look after many of your systems tasks with a standard extendable interface. Many third party modules exist to allow more control over different tasks.

This new version has new modules for handling IPsec VPN configuration of FreeSWAN, User management for groups and users within an LDAP database. It has also improved the file manager and ssh modules so you can use a Mac OS X browser to configure your system.

## Kroupware 1.0

Kroupware is a Free Software Groupware solution which is accessible from both MS Windows running Outlook and Linux computers running KDE clients.

Kroupware is written for KDE 3 and was commissioned as a replacement for MS Exchange. It provides Email, Tasks, Calendar, Contract, Notes and share resources.

## Samba 3.0.0 Beta2

This is the second beta release of the Samba 3.0.0 code base. The major new features available in this code base is the incorporation of Active directory support and can as a member of an ADS realm, authenticate users using LDAP/Kerberos. Internally the authentication system has now been rewritten.

## Netscape 7.1

The Netscape 7.1 suite is based on the Mozilla 1.4 browser. This is then combined with the Gecko runtime environment and the Mozilla ActiveX control and plug-in. Automatic image resizing is now included where any large image is rescaled until it is capable of fitting on the screen.

In the suite's Mail and Newsgroup section it now boasts enhanced spam detection, message views and improved filtering. The suite also includes Palm synchronization and Composer to help you create a web site.

## Epiphany

Epiphany is a Gnome web browser based on the Mozilla rendering engine. The aim is to produce a browser based on simplicity and standards compliance. By using the simplest interface it is a powerful bloat-free tool, without the usual email and newsgroup readers being included.

By being modular, Epiphany has the power to access web features and the speed gained from a small fast core.

## Wine

Wine is an open source implementation of the MS Windows API on top of X. Wine does not require MS Windows and is capable of running on 100 percent MS-free code. If you have them available however, you can add in native DLL files.

Wine is not an Emulator but can be thought of as a Windows compatibility layer.

## Nmap 3.30

Nmap ("Network Mapper") is an open source utility for network exploration or security auditing. It was designed to rapidly scan large networks, although it works fine against single hosts. While Nmap offers a rich set of advanced features, you can start out as simply as "nmap -O targethost". ■
